

Professional
AssetManagement

Get a chain that makes your IT investment more valuable. Save employee time and your money. Keep track of your inventory, know how many assets of different kind are on which locations.

Keep track of incidents on your assets, solutions or customers with builtin IncidentSystem.

Professional AssetManagement

Why Use Noah?

Simply put - it is a must. Knowing how to find your assets, what they have inside them and track what is being done with them is mandatory. And assetmanagement saves you time and money.

Imagine knowing that a server is in one of your datacenters. And a disc is to be replaced. Finding it without exact location could take hours or even days. And having registered the disc size, model or even serial number - you spare your self replacing the replacement.

How do I implement it then?

Well, the system it self is setup on a webserver of basicly any kind (demands PHP installed). But the real obstacle is the process of and around registering the assets. We can help you with that.

ITIL, and so what?

AssetManagement is not only something to support an ITIL process. It is a part of the process. A tool to make sure you follow a part of ITIL.

Use it the way it is ment to

Optimize your ISO/ITIL process with Noah and processes that follows. Located in the Procedures folder.
